## *Planning a conference in Toronto*

Being a technology hub, Toronto is one of the most sought-after places for arranging technical conferences. To be able to host perfect events, we will need to find best venues for stay and meeting halls. It will also be beneficial to add places to visit (landmarks) and to eat for people attending a conference to wind-down later.

The idea then is to find the best location that is fit to be a good place to reside and have meeting halls, along with being close to places to eat, shop or spend evenings after a hard day needs to be found.

Information about hotels, restaurants, landmarks (location, venues etc.) for further required. This included Latitudes and Longitudes of the neighbourhoods, Hotels dataframe, Restaurants/cafe dataframe, Venue data etc. Foursquare API was used to get the best results for finalizing the place.

After arranging, sorting the data and understanding clustering; maps were then used to understand the best locations overall.

Neighbourhoods including shopping stores and cafeteria.

Neighbourhoods with landmarks, stores and cafeterias
